

HIT Card Project

Health Information Technology (HIT) Card System is a built – in system inside the authorized credit cards. The medical and insurance information inside the sim of the credit card can only read by the card holder or with their permission by an authorized healthcare provider. Every time card holder visits any of the participating providers, the card information will be updated. That way, the card holder always has the most up-to- date information all in one place. This system gives an increased efficiency and accuracy in dispensing medication. Patients at high risk with special conditions can quickly and easily be recognized, especially in an emergency. Nowadays, only the public medical sector starts the similar "eHealth" system in Hong Kong. With the implementation of HIT Card system, people using private medical providers can also be benefit. This system is more flexible and be easily extended to worldwide usage.
